

PROTOTYPE SHOWCASE

**School employment reports
still start with two SAS programs
and a shared output folder.**

We replaced the desktop ritual with a signed-in product — without inventing a single business rule.

WE BUILT

Meridian Test Client

The reporting shop's command center: import the graduate workbook, generate the same seven-page school PDF, download only what you are allowed to see, and ask questions that stay inside authorized evidence.

.NET 8 · SQLite · React · QuestPDF · Identity · Knowledge Assistant

A reporting shop that must ship one PDF per school, every cycle.

They receive

An Excel extract of graduates: employment, demographics, employer type, region, salary.

They must produce

One Class of 2025 letter PDF per school. Seven pages. Same tables the schools already recognize.

They cannot break

Salary suppression. Recodes. Totals. Who is allowed to open which file.

Yesterday's “product” was a specialist and a folder.

Install SAS 9.4

Point two programs at local paths. Hope the folders exist.

Run the black box

createschrptfiles2025.sas,
then
schreptsummary_2025.sas
.

Collect PDFs

ODS print layout. Shared output. No sign-in.

Email the files

Anyone with the folder sees every school.

**If only one person can run SAS,
the shop cannot scale — or prove — a cycle.**

No dashboard of what is actually stored.

No run history when a school asks “did you generate mine?”

No test that salary stats stay hidden when $n < 5$.

No 404 when the wrong person guesses a download link.

A print PDF: only the first school's ods pdf used the accessible option.

Same SAS rules. A product instead of a ritual.

Meridian Test Client is a local web app that runs the characterized school-employment pipeline — import, calculate, generate, authorize, answer — without rewriting the business logic to look cleaner.

Keep

CF-S-00. Seven pages. Gray headers. “.” for missing. Class of 2025 / July 2026.

Add

Sign-in, school grants, run history, year dashboard, tagged PDF, Adobe-checked reading order.

Refuse

Invented suppression. Restyled reports. A second database. The assistant as the calculator.

Six clicks. One cycle.

1 Sign in

Identity cookie. Admin, report user, or viewer.

2 Import

Admin drops the .xlsx. Invalid rows logged. Duplicate hash rejected.

3 See stock

Dashboard: schools and graduates by class year from stored rows.

4 Generate

One school or all. Sequential or bounded parallel (1–8).

5 Deliver

Authorized /downloads/reports/{id}. Else 404.

6 Ask

Assistant quotes printed PDFs and docs. It does not rerun SAS.

Seven letter pages. We did not redesign the report.

What they open

Page 1: Total Reported under the headers. Employment, gender, race, employer type, region, salaries. Note, then test-client footer in the flow. Missing cells stay “.” — screen-reader name: Not displayed.

What we added behind it

Tags, language, reading order. Adobe Acrobat accessibility checker: passed, screen order correct. That check is recorded separately. Not a veraPDF / PAC / NVDA pack.

The wrong person never “finds” another school.

Admin

Loads the cycle. Can generate every school.

Report user

Generates a school they are granted.

Viewer

Reads granted reports. Cannot import. Cannot generate all.

No grant

Guessing a report id returns 404 — no name, no path.

Ask the reports. Do not ask the model to invent totals.

The Knowledge Assistant searches authorized catalog text and generated PDFs. It quotes printed figures. It can sum printed Total Reported. It never recalculates SAS, salaries, or suppression from raw rows.

This report

Locked to one PDF you can view.

All reports you can see

Sums, last year, difference — from printed numbers.

No evidence

We show Insufficient evidence. We do not guess.

We characterized SAS before we wrote C#.

Every count, recode, and suppression has a Rule ID. Eighteen ambiguous cases stayed skipped. We did not “clean up” the rules to make a prettier demo.

CF-S-00 — the line investors should remember

Salary statistics print only when $n \geq 5$ on non-missing full-time long-term salaries. Not on headcount. An AI proposal to emit salaries when $n < 5$ was rejected. The test still fails that change on purpose.

A running prototype. Tests. A human veto log.

Live app

Sign-in, import, generate, history, assistant — <https://localhost:7117>

Locked rules

Characterization + calculator tests. CF-S-00 cannot silently change.

Adobe check

Accessibility checker passed. Reading / screen order correct.

CI gate

GitHub Actions builds and tests on main and every PR.

Authz proof

Unauthorized download is 404. RAG filters before the model.

Honest miss

Baseline PDF vs sample Excel is a known population mismatch. We did not chase it.

SAS still knows the rules. It is not a product.

SAS shop

License + local paths

Rules untested

Print PDF

Shared folder = access control

Staff memory = knowledge base

Meridian Test Client

Browser + SQLite, no SAS to run a cycle

Rule IDs + automated tests

Same look, tagged, Adobe-checked

Roles and school grants on the server

Assistant on authorized evidence only

Don't take the slides. Take the product.

Admin signs in. Dashboard shows stored graduates by year.

Import is Admin-only. A repeat file is rejected.

Generate one school. Open the seven-page PDF.

Ask: "What is Total Reported in this report?"

Sign in as Viewer. Import denied. Wrong PDF id → 404.

We will not oversell the prototype.

What is true

Local MVP. SQLite only. Totals from C#. Adobe Acrobat checker observed on generated PDFs. Human rejected “print salaries when $n < 5$.”

What is not claimed

Cloud scale. A second database. veraPDF / PAC / NVDA pack. Playwright CI. Matching the Test University baseline headcount. The assistant as source of truth.

Green-light the prototype. Hold the rules.

This capstone is ready to demo as a shop tool. The next money — if it ever comes — is validation packs, a real identity provider, and performance on a full generate-all. Not a rewrite of CF-S-00.

Use it

Run a cycle on the sample workbook.
Generate one school. Download as
Admin and fail as Viewer.

Judge it

Did we preserve SAS? Did we lock
suppression? Did we stop the wrong
download?

Don't ask us to

Restyle the PDF. Guess skipped SAS. Put
Excel rows into the assistant index.

MERIDIAN TEST CLIENT

**The reports did not change.
The shop finally can.**

Questions.

Class of 2025 · July 2026 · [docs/capstone-demo/](#)
